

2 APRIL 2025

MEME STOCK & CRYPTO PREDICTOR

vishnu naik

WHAT IS THIS PROJECT?

IN SIMPLE WORDS:

This is like a **"hype detector"** for stocks and cryptocurrencies. It scans social media (Reddit, Twitter) to see what people are talking about, then predicts which stocks or crypto might suddenly go up in price .

EXAMPLE:

- Remember GameStop (\$GME) in 2021? A group of Reddit users made it famous, and its price skyrocketed.
- Or Dogecoin (\$DOGE) , which started as a joke but became worth billions. This tool tries to find the next GameStop or Dogecoin before it blows up. .

2. KEY TERMS

EXPLAINED

A. WHAT ARE "MEME STOCKS"?

- Definition: Stocks that become extremely popular because of internet hype , not because of the company's real value.
- Example: GameStop (\$GME), AMC (\$AMC), BlackBerry (\$BB).
- Why? People on Reddit/Twitter collectively decide to buy them, making prices surge.

B. WHAT ARE "CRYPTOCURRENCIES"?

- Definition: Digital money (not controlled by banks).
- Examples: Bitcoin (\$BTC), Ethereum (\$ETH), Dogecoin (\$DOGE).
- Why Do They Go Viral? Just like meme stocks, if enough people talk about them, prices can jump.

C. WHAT DOES "PREDICTOR" MEAN?

- The tool doesn't know the future , but it uses AI and data to guess which stocks/crypto might rise soon.
- It's like a weather forecast —not 100% accurate, but gives a good idea.

3. HOW DOES IT WORK? (STEP-BY-STEP FOR BEGINNERS)

STEP 1: SCANNING SOCIAL MEDIA

- Reddit (especially WallStreetBets – a group where traders discuss stocks).
- Twitter (people post about stocks/crypto with \$ or symbols, like \$GME or Bitcoin).
- The tool automatically collects these posts.

STEP 2: FINDING STOCK & CRYPTO NAMES

- People use short names for stocks/crypto:
 - \$GME = GameStop
 - \$DOGE = Dogecoin
 - \$AMC = AMC Theatres
- The tool detects these names and counts how often they appear.

STEP 3: CHECKING IF PEOPLE ARE EXCITED (SENTIMENT ANALYSIS)

- Not just how many posts mention a stock, but how positive they are.
- AI looks for phrases like:
 -  "To the moon!" = People think it will rise.
 -  "Diamond hands" = People won't sell.
 -  "This is trash" = People are negative.

STEP 4: CALCULATING A "HYPE SCORE"

- Combines:
 - How many posts mention it.
 - How positive people are.
 - How fast it's growing in mentions.
- Higher score = more likely to surge .

STEP 5: SHOWING RESULTS TO USERS

- A dashboard (like a website) shows:
 -  Top trending stocks/crypto
 -  Charts of past trends
 -  Alerts if something spikes suddenly

4. WHY WOULD SOMEONE USE THIS?

- Retail Investors (Normal People)
 - Want to find the next big thing before it's too expensive.
- Crypto Traders
 - Looking for new coins before they explode (like Shiba Inu did).
- Hedge Funds (Big Money Firms)
 - Want to see what small investors are doing.

5. REAL-LIFE EXAMPLE

WHAT HAPPENED WITH GAMESTOP (\$GME)?

1. Reddit users noticed hedge funds were betting against GameStop.
2. They organized to buy it, making the price go up 1,500% .
3. This tool would have detected the hype early and alerted users.

WHAT HAPPENED WITH DOGECOIN (\$DOGE)?

1. Started as a joke, but Elon Musk tweeted about it .
2. Reddit & Twitter went crazy , price jumped 10,000% .
3. This tool would have seen the trend growing before the peak.

6. IS THIS GUARANTEED TO WORK?

- No. It's a prediction , not a crystal ball.
- Helps increase chances of spotting trends early.
- Still requires smart decisions (don't blindly follow hype).

7. SUMMARY

- ✓ Scans Reddit/Twitter for stock/crypto mentions.
- ✓ Checks if people are excited (AI sentiment analysis).
- ✓ Ranks them by "Hype Score" (higher = more likely to rise).
- ✓ Alerts users before big moves happen.

This is not financial advice , but a tool to help spot trends faster .

**HERE'S THE
SIMPLEST
POSSIBLE
EXPLANATION
WITH A REAL-LIFE
EXAMPLE:**

IMAGINE YOU'RE AT A PARTY 🎉

- You notice a small group of people suddenly getting really excited about a new snack (let's say "Spicy Doritos").
- More and more people start talking about it.
- Some start yelling, "These are the BEST chips ever!"
- A few even run to the store to buy all the Spicy Doritos before they sell out.

WHAT HAPPENS NEXT?

- Because so many people want Spicy Doritos, the store raises the price (supply & demand).
- People who bought them early got them cheap.
- Those who joined late paid way more or missed out.

HOW THIS APP HELPS YOU

This tool is like having a spy at the party who tells you:

> "Hey, Spicy Doritos are trending! People are going crazy for them. Buy some NOW before prices go up!"

REAL STOCK/CRYPTO EXAMPLE: GAMESTOP (\$GME)

1. Reddit users noticed hedge funds were betting against GameStop.
2. They started posting : "Let's all buy \$GME and make it go up!"
3. The hype grew → more people bought → price jumped 1,500% in weeks.
4. Those who bought early made huge profits. Others lost money buying at the peak .

HOW THE APP WOULD'VE HELPED

- It would've detected the Reddit hype early .
- Sent you an alert: "\$GME trending! Bullish posts surging!"
- You could've bought low before the explosion .

WHY THIS IS USEFUL

- Saves time : No need to scroll Reddit/Twitter for hours.
- Early warning : Lets you act before the crowd.
- Avoids FOMO : Helps you not buy at the top (when it's too late).

BUT REMEMBER:

- Not every trending stock moons (some crash).
- Always do your research — don't blindly follow hype.

Think of it like a "hype radar" for stocks/crypto. 🚀

Still too complex? Think of it like a "Google Trends.. for money-making trends." 🔍💰

HERE'S EXACTLY HOW THIS TOOL BENEFITS YOU IN PLAIN TERMS:

1. YOU COULD SPOT MONEY-MAKING OPPORTUNITIES EARLY

(Like finding a \$10 bill before others see it)

- The app detects when Reddit/Twitter users start obsessing over a stock/crypto before news outlets report it .
- Example: If it notices 1,000% more people suddenly talking about \$XYZ coin , it alerts you while it's still cheap .

2. YOU AVOID BUYING AT THE PEAK (LOSING MONEY)

(Like realizing a concert is sold out before you Uber there)

- Many people lose money by buying stocks/crypto after they've already spiked.
- This tool shows you rising hype before the price explodes , so you don't join too late.

3. SAVES YOU HOURS OF RESEARCH

(Like having a friend summarize a 3-hour movie for you)

- - Instead of scrolling through thousands of Reddit/Twitter posts , the AI does it instantly.
- - You get a simple list : "Top 5 trending stocks this hour + how excited people are."

4. HELPS YOU UNDERSTAND CROWD PSYCHOLOGY

(Like seeing which way a herd of sheep is running before you join)

- You'll learn:
 - Are people greedy (buying like crazy)? → Maybe time to sell .
 - Are they fearful (panic selling)? → Maybe time to buy cheap .

5. WORKS FOR BOTH SHORT-TERM AND LONG-TERM

- Day Traders : Catch quick pumps (hold for hours/days).
- Long-Term Investors : Notice if a crypto (e.g., Bitcoin) is gaining real adoption vs. just hype.

REAL-LIFE BENEFIT EXAMPLE:

Scenario:

- On Monday, the app alerts you: "\$DOGE mentions up 500% on Reddit. Sentiment: SUPER bullish."
- You buy \$100 of Dogecoin at \$0.10 per coin .
- By Friday, hype peaks → price hits \$0.50 . You sell and turn \$100 into \$500 .
- Without the app? You might've bought at \$0.50 after seeing headlines, then lost money when it crashed.

But a Warning:

- ⚠️ Not magic : Some trends fizzle out (you could lose money).
- ⚠️ Don't gamble : Only invest what you can afford to lose.
- ⚠️ Combine with common sense : If something sounds too good to be true, it might be.

TL;DR – Why You'd Use This:

- ✅ Find opportunities early (before prices spike).
- ✅ Avoid costly FOMO mistakes (buying at the top).
- ✅ Save time by automating research.
- ✅ Learn market patterns over time.

Think of it as **"a hype alarm clock for stocks/crypto"** 🕒🚀 – it wakes you up before the crowd starts rushing in.

HOW THE MEME STOCK & CRYPTO PREDICTOR WORKS (DEEP DIVE)

Let me break down each step of the system in extreme detail - from data collection to real-time alerts - so you understand exactly how our app will function.

HOW IT WORKS (SIMPLE VERSION)

THE SYSTEM WORKS IN 4 STEPS:

1. Data Collection

- Scans **Reddit** (like WallStreetBets) and **Twitter** for stock/crypto mentions.
- Tracks keywords like "\$GME" (GameStop) or "#DOGE" (DogeCoin).

2. Sentiment Analysis

- Uses AI to detect if people are **bullish (positive)** or **bearish (negative)**.
- Recognizes meme phrases like "To the moon!" or "Diamond hands."

3. Prediction Engine

- Combines **hype, volume, and past trends** to rank stocks/crypto.
- Gives each a "**Hype Score**" (higher score = more likely to surge).

4. Real-Time Alerts

- Shows **trending stocks/crypto** in a dashboard.
- Sends **instant alerts** when something spikes.

1. DATA COLLECTION: THE SOCIAL MEDIA RADAR

What's Happening Behind the Scenes

What's Happening Behind the Scenes

Your app constantly scans these platforms 24/7:

Platform	Key Communities	How Often	Data Collected
Reddit	WallStreetBets, CryptoCurrency, StockMarket	Every 2-5 minutes	Posts, comments, upvotes, timestamps
Twitter (X)	Finance influencers, trending hashtags	Every 1-2 minutes	Tweets, likes, retweets, replies
Discord	Trading servers (optional expansion)	Future phase	Message volume, emoji reactions

Caption

TECHNICAL IMPLEMENTATION

■ Uses Python libraries:

- `PRAW` for Reddit API
- `Tweepy` for Twitter API
- `Discord.py` (for future Discord integration)

■ ****Keyword Tracking****:

- Stocks: `\$GME`, `\$AMC`, `\$TSLA`
- Crypto: `#BTC`, `#DOGE`, `#SHIB`
- Meme phrases: "to the moon", "diamond hands"

****Example Workflow****

1. Script checks r/WallStreetBets/new every 3 minutes
2. Finds post: "\$GME is about to explode! 🚀"
3. Records:
 - Post text
 - 250 upvotes in 5 minutes (high velocity)
 - 82 comments (engagement)

2. SENTIMENT ANALYSIS: THE AI MIND READER

****HOW IT DETERMINES BULLISH VS. BEARISH****

Our AI examines two key elements:

****A. Natural Language Processing (NLP)****

- Uses ****BERT**** / ****FinBERT**** (financial-optimized model)
- Classifies sentences as:
 -  ****Bullish**** (Positive):
 - *"This is going to the moon!"*
 - *"Just bought 1000 shares - diamond hands!"*
 -  ****Bearish**** (Negative):
 - *"This is a scam, dumping my bags"*
 - *"Rug pull incoming!"*
 -  ****Neutral****:
 - *"What's the current price of BTC?"*

****B. Meme Phrase Detection****

Special dictionary looks for:

****Hype terms**:**

, , "LFG", "YOLO", "Apes together strong"

****Warning terms**:**

, "RIP", "bagholder", "dump it"

****Scoring System****

Each post gets:

****Sentiment score**:**

-1 (bearish) to +1 (bullish)

****Hype multiplier**:**

"To the moon!" = +0.3

Rocket emoji = +0.2

****Technical Implementation****

```
post = "GME to the moon! 🚀"
```

```
result = sentiment_analyzer(post)
```

```
# Output: {'label': 'positive', 'score': 0.98}
```

```
---
```

3. PREDICTION ENGINE: THE HYPE SCORE CALCULATOR

How the Magic Happens

Combines multiple factors into one **Hype Score** (0-100):

Factor	Weight	Calculation	Example Input	Example Output
Mention Volume	30%	# of mentions/hour vs. average	500 mentions (normally 50)	Score: 90/100
Sentiment	25%	Avg. sentiment score	0.85 (very bullish)	Score: 85/100
Engagement	20%	Upvotes/comments per minute	100 upvotes in 5min	Score: 80/100
Historical Trend	15%	Comparison to past pumps	Similar to \$GME Jan 2021	Score: 75/100
Influencers	10%	Big accounts tweeting	Elon Musk mentions it	Score: 95/100

Caption

****Algorithm Pseudocode****

```
def calculate_hype_score(ticker):
```

```
    volume_score = (current_mentions / avg_mentions) * 30
```

```
    sentiment_score = avg_sentiment * 25
```

```
    engagement_score = (upvotes_per_min / 10) * 20
```

```
    trend_score = compare_to_historical(ticker) * 15
```

```
    influencer_score = check_elon_musk(ticker) * 10
```

```
    return volume_score + sentiment_score + engagement_score + trend_score +  
    influencer_score
```

****Example Output****

- ****\$DOGE****:

- 1,200 mentions (+300%)

- 0.92 sentiment

- 500 retweets/min

- Similar to 2021 pump

- ****Final Hype Score: 88/100**** → ****STRONG BUY SIGNAL****

****4. REAL-TIME ALERTS: YOUR PERSONAL TRADER ASSISTANT****

****How Users Get Notified****

****Dashboard Features****

****Top 5 Trending**** (Auto-updating every minute)

```markdown

1. \$GME - Hype Score: 92 🚀

2. #DOGE - Hype Score: 88 🌙

3. \$AMC - Hype Score: 76 🔥

```

- ****Historical Chart****: Shows 24hr hype trend

- ****News Integration****: Related headlines

****Alert Types****

1. ****Web Push****: " 📢 \$GME hype spiking! (Score: 92)"

2. ****Email Digest****: "Top 3 trending assets today"

3. ****Discord/Telegram Bots****: "Alert: #SHIB mentions up 400%"

****Putting It All Together: End-to-End Example****

****Scenario: Dogecoin Starts Trending****

1. ****Data Collection****:

- 500 tweets with #DOGE in 10 mins
- Reddit post: ****DOGE hitting \$1 soon!**** (2k upvotes)

2. ****Sentiment Analysis****:

- 87% positive sentiment
- 32 🚀 emojis detected

3. ****Prediction Engine****:

- Volume: 95/100
- Sentiment: 88/100
- ****Total Hype Score: 90/100****

4. ****Real-Time Alert****:

- All users see: " 🔥 #DOGE TRENDING (Score: 90)"
- Premium users get SMS: "DOGE hype accelerating - similar to 5/2021 pump"

****KEY TECHNICAL REQUIREMENTS****

1. ****Backend****:

- Django/FastAPI for API
- Celery for task queues
- Redis for caching

2. ****Database****:

- PostgreSQL for relational data
- TimescaleDB for time-series (price/hype history)

3. ****Infrastructure****:

- AWS EC2 or Lambda
- Cloudflare for rate limiting

This is how our app transforms ****social noise**** into ****tradable signals****.

KEY FEATURES

Feature	What It Does
Real-Time Social Media Scanning	Monitors Reddit & Twitter 24/7
AI Hype Detection	Spots bullish/bearish trends
Hype Score	Ranks stocks/crypto by potential growth
Historical Charts	Shows past performance
Instant Alerts	Notifies users of sudden spikes
Premium Analytics	Advanced stats for paid users

Caption

TECHNICAL OVERVIEW (SIMPLE, NO- JARGON VERSION)

Let me explain how this app works technically – but in plain English, like I'm describing it to a friend who's never coded before.

1. The Big Picture:

Imagine your app is like a **weather station for internet hype**:

- **Thermometer** = Measures how "hot" a stock/crypto is
- **Barometer** = Detects if excitement is rising or falling
- **Weather Alert System** = Warns you before a "hype storm" hits

HERE'S HOW IT'S BUILT:

The 4 Main Technical Parts

A. The "Ears" of the App (Data Collection)

What it does: Listens to social media 24/7

How it works:

- Uses **pre-built tools** (like Twitter/Reddit's official "data pipes")
- Looks for:
 - Stock symbols (\$GME, \$AMC)
 - Crypto hashtags (#DOGE, #BTC)
 - Key phrases ("to the moon", "diamond hands")

Real-world analogy:

Like a Google Alert for stock mentions, but automated.

B. The "Brain" of the App (Sentiment Analysis)

What it does: Reads posts and decides if they're:

- 😊 Positive (bullish)
- 😡 Negative (bearish)
- 😐 Neutral

How it works:

- Uses **AI trained on millions of finance posts**
- Recognizes:
 - Emojis (🚀 = good, 💀 = bad)
 - Slang ("YOLO" = bullish, "bagholder" = bearish)

Real-world analogy:

Like a teacher grading essays as "positive" or "negative" – but instant and automated.

C. The "Calculator" (Prediction Engine)

What it does: Combines:

1. How **often** something is mentioned
2. How **positive** people are
3. How **fast** hype is growing

Then gives a **Hype Score** (0-100).

How it works:

- Weights recent activity more heavily
- Compares to past surges (e.g., "This looks like GameStop in 2021")

Real-world analogy:

Like a credit score, but for stock hype instead of loans.

D. The "Megaphone" (Alerts & Dashboard)

What it does: Shows users:

-  **Live rankings** of trending stocks/crypto
-  **Charts** of hype over time
-  **Instant alerts** (like a stock market tornado siren)

How it works:

- Updates every **60 seconds**
- Sends notifications via:
 - ☐ App alerts
 - ☐ Email
 - ☐ Text messages (for premium users)

Real-world analogy:

Like a sports ticker showing which teams are gaining fans fastest.

3. Where Everything Lives (Tech Infrastructure)

A. The "Library" (Database)

- Stores:
 - All social media posts
 - Hype scores over time
 - User accounts

Type: PostgreSQL (like an Excel spreadsheet but way more powerful)

B. The "Factory" (Backend)

- Runs the AI analysis
- Calculates scores
- Sends alerts

Tools: Python + Django (like a robot assembly line)

C. The "Storefront" (Frontend)

- What users see and interact with
- Shows trends, charts, alerts

Tools: Next.js (like building a website with Lego blocks)

D. The "Delivery Trucks" (Cloud Servers)

- Hosts everything online 24/7
- Scales up when more people use the app
-

Providers: AWS/Azure (like renting space in a giant computer warehouse)

4. How Data Flows (Step-by-Step Example)

Let's follow **\$DOGE** through the system:

1. **Reddit user posts:** "DOGE to \$1! 🚀"
→ App's "ears" detect this

2. **AI brain analyzes:**

- "DOGE" = crypto ticker
- "🚀" = very positive

→ Scores as **95% bullish**

3. **Calculator checks:**

- 500+ DOGE mentions this hour (normally 50)
- Similar to May 2021 pump

→ **Hype Score: 88/100**

4. **Megaphone alerts:**

- Updates dashboard
- Sends push notification: "*#DOGE trending (Score: 88)*"
